

Vincent Zaballa | Ph.D.

Irvine, CA

 [vz415.github.io](https://github.com/vz415) •  [vz415](https://twitter.com/vz415)

Education

University of California, Irvine

Ph.D., Biomedical Engineering

Thesis: "Machine Learning Methods for Posterior Approximation, Mutual Information Optimization, and Integrating Structural and Systems Biology in Drug Discovery."

Irvine, CA

2019–2026

Imperial College London

M.Res., Bioengineering

London, UK

2015–2016

Texas A&M University

B.S. & M.Eng., Biomedical Engineering, Minor in Electrical Engineering, cum laude

College Station, TX

2010–2015

Research Interests

My research develops score-based diffusion (flow matching) models and normalizing flows for scientific applications. I am particularly interested in (1) diffusion transformer architectures, including principled fine-tuning, compositional sampling, and hierarchical inference over structured biological data; (2) connecting generative modeling with Bayesian experimental design to enable simulation-efficient active learning under epistemic uncertainty; (3) integrating models across biological scales to enable multi-modal generative approaches for perturbation modeling, molecular design, and structured biological inference; and (4) LLM-augmented experimental design. I enjoy building theoretical foundations and translating them into working code, fast, and contributing to open-source tools when possible (Radical Numerics, LFIAX, JAX Optax).

Experience

University of California, Irvine

Graduate Research Assistant

Irvine, CA

Sept. 2019–2026

- **[BOED-agents]** Building an agentic system for simulator-agnostic Bayesian optimal experimental design that adaptively selects models, infers parameters, and proposes informative experiments under simulator uncertainty and fixed experimental budgets.
- **[BMP Simformer]** Developed novel score-based diffusion transformer foundation model to expand the predictive capabilities of systems biology. (*NeurIPS workshop*/In submission at ICLR 2027)
- **[BMP Simformer]** Implemented a principled fine-tuning method for score-based diffusion models using full diffusion rollouts regularized by the reverse KL divergence to the pretrained model, leveraging the Girsanov theorem to regularize over path measures rather than naïve parameter-space distances — reducing posterior inference RMSE by 97% ($14.43 \rightarrow 0.389$) and introducing a novel model misspecification technique $\mathcal{A}(\theta, \xi)$ that indicates where an expert simulator may be misspecified.
- **[BMP Simformer]** Derived compositional posterior sampling diffusion coefficient $g_n(t)$ that improves accuracy & numerically stabilizes Langevin sampling of continuous-time diffusion models to n -dependent observations, and developed Hierarchical Blockwise Diffusion Sampling (HBDS) for joint inference of shared parameters and group-specific nuisance variables — compressing posterior inference from 10,400 to 71 random variables.)
- **[SBI-BOED]** Proved that maximizing an InfoNCE mutual information bound is equivalent to jointly minimizing KL divergence of a surrogate likelihood and optimizing experimental designs, enabling Bayesian optimal experimental design for *non-differentiable* simulators with 52% better predictive accuracy and $\sim 50\times$ fewer simulator calls than competing methods. (*coded in LFIAX*/Accepted at UAI 2026)
- **[SBI-BOED]** Developed a simulation-efficient active learning scheme in SBI, using MC-dropout uncertainty estimates to prioritize simulator queries in InfoNCE, reducing posterior calibration error up to 50% over random sampling under fixed simulation budgets.
- Developed new method to perform diffusion guidance applied to small molecule generation in systems biology and structure-based drug design (coded in PyTorch). (*NeurIPS MLSB*, 2024).
- Demonstrated a new approach to integrating structural and systems biology information, improving predictions by 1.34% without collecting additional experimental data (*ICML ML4LMS*, 2024).
- Modeled the intractable likelihood of a high-dimensional dataset of the Bone Morphogenetic Protein (BMP) signaling pathway using normalizing flows (*NeurIPS GenBio*, 2023).
- Created a novel approach for optimizing Mutual Information & experimental designs in Simulation-based Inference, improving feasibility in high-dimensional design optimization (*ICML DAE*, 2023).
- Developed automated biological model selection algorithm with 166–298% better accuracy over baseline methods (*ICML CompBio*, 2022).
- Improved average experimental design efficiency by 225% using surrogate probabilistic modeling of physics-based biological models and Bayesian optimization (*NeurIPS LMRL*, 2021).

Fannin Innovation Studio

Project Manager

Houston, TX

June 2018–Aug. 2019

- Managed commercialization and R&D of a pioneering fetal surgery device, resulting in a \$2 million SBIR Phase II Grant.
- Managed two hardware engineers and one software engineer – introduced new quality control computer vision software in OpenCV.

Drip

Data Scientist

Colorado Springs, CO

April 2017–Oct. 2017

- Developed analytics and machine learning algorithms to draw insights from Colorado water data records within a SaaS application.

Cambiando Paradigmas

Data Analyst

La Paz, Bolivia

Jan. 2017–June 2018

- Improved returns from renewable energy investments by 4.5x over previous portfolio, using random forests and optimization.

Imperial College London

Whitaker Fellow

London, UK

Oct. 2015–Oct. 2016

- Designed a novel orthopedic implant that reduces typical bone strain by 90% (validated via finite element analysis).

Biomedical Device Lab, Texas A&M

Research Assistant

College Station, TX

Jan. 2013–May 2015

- **Undergraduate Research Scholar Thesis:** “Characterization Of Automatically Reticulated Shape Memory Polymer Foams.”
- Created an automated system for processing Shape Memory Polymer (SMP) foams, reducing manufacturing time by 4.5 hours.

Invited Talks & Presentations

Dec. 2025: “Diffusion transformers as novel foundation models for systems biology.” *Neural Information Processing Systems (NeurIPS) Latinx in AI Workshop, San Diego, CA.*

Apr. 2025: “Optimizing Likelihoods via Mutual Information: Bridging Simulation-Based Inference and Bayesian Optimal Experimental Design.” *Lightning Talk at Stanford Experimental Design: AI for Science 2025, Palo Alto, CA.*

Apr. 2022: “Optimal Design of Experiments for Simulation-Based Inference of Mechanistic Acyclic Biological Networks.” *Lightning Talk at UCLA SoCalSysBio 2022, Los Angeles, CA.*

Software

Contributor, [Radical Numerics](#) Discrete Diffusion Language Modeling (2025) - Implemented Entropy-Bounded sampler

Contributor, [JAX Optax](#) optimization library (2023–2024)

Creator, [LFIAX](#): JAX conditional normalizing flows (2022)

Teaching Experience

Engineering Analysis/Design: Data Analysis

Teaching Assistant

University of California, Irvine

Winter 2026

- Led recitation sections and addressed questions in a sophomore-level data analysis and programming course.

Biology 50A: Cell and Molecular Engineering

Teaching Assistant

University of California, Irvine

Winter 2025

- Led recitation sessions and addressed questions in a sophomore-level biology and synthetic biology class.

Maths 2

Teaching Assistant

Imperial College London

Oct.–Dec. 2015

- Led recitation sessions in multivariate calculus and differential equations for second-year students.

Academic Service

2021–2025: Reviewer, AISTATS (2022, 2023, 2025, 2026)

2025–2026: Reviewer, NeurIPS (2025, 2026)

2024–2026: Reviewer, ICLR (2025, 2026, 2027)

2022: Contributor, *Probabilistic Machine Learning: Advanced Topics* by Kevin Murphy

Funding

2025: NSF Innovation Corps (I-Corps) grant: \$50,000

2022: NIH F31 Ruth R. L. Kirschstein Research Service Award Fellowship: \$125,000

Awards & Fellowships

2022: ARCS Scholar Award (\$10,000)

2021: Google Computer Science Research Mentorship Program (Google mentor)

2021: Summer Inclusive Excellence Award – *for promoting minority access to undergraduate research* (\$5,000)

2017: Go Code Colorado Hackathon Winning Team (\$25,000)

2015–2016: Whitaker International Fellowship (\$75,000)

2015: Imperial College London Postgraduate Award for Outstanding Students (\$10,000)
